Fix [Julia Version]

Fix is a simplification of the **Prefix** (and also of the **Revolver**) crypto-system. The innovation is making the set of names of the states itself an instantaneous code. Then each state also writes a subset of other state names, depending on the single input symbol of the plaintext. This means that each state (its name part of the larger prefix code) also writes a prefix code (a subset of state names), and this is how the function stays invertible.
